IMAGING REPORT

---

PATIENT: SALANTI, ANNA M                      AGE: 79    SEX: F    MR #: 005734  
ACCOUNT NO: 9491689                      SOURCE: O                      X-RAY#: 163059  
PHYSICIAN: HARVEY J STERNBERG, M.D.                      DATE: 12/27/2001

---

EXAM NAME: PA &amp; LATERAL CHEST

HISTORY: Fever and dyspnea

The left pleural effusion noted on August 9th has completely resolved. Minimal pleural fluid or pleural thickening remains on the right side. There is a small amorphous soft tissue density at the right lung base, most compatible with a small infiltrate, fibrosis or subsegmental atelectasis, which is much lesser in size than the vague opacification noted at the right lung base in a prior study.

The heart is borderline in size and the aorta mildly tortuous.

IMPRESSION: Marked improvement since August 9th without evidence of likely acute disease.
